Figure 1: Decision matrix results for 1975 to 2020.

Background

Light availability to seagrass is the guiding paradigm for TBEP's Nitrogen Management Strategy. Because excessive nitrogen loads to the bay generally lead to increased algae blooms (higher chlorophyll-a levels) (Figure 2) and reduce light penetration to seagrass, an evaluation method was developed to assess whether load reduction strategies are achieving desired water quality results (i.e. reduced chlorophyll-a concentrations and increased water clarity).

Figure 2: Seagrass restoration with N management.

Decision Support Approach

Year to year algae abundance (measured as chlorophyll-a concentrations) and visible light penetration through the water column (secchi disk depth visibility) have been identified as critical water quality indicators in Tampa Bay. Tracking the attainment of bay segment specific targets for these indicators provides the framework for developing and initiating bay management actions. TBEP management actions adopted in response to the annually-assessed decision support results are shown to the right.

G	"Stay the Course" Continue planned projects. Report data via annual progress reports and Baywide Environmental Monitoring Report.
Y	"Caution" Review monitoring data and nitrogen loading estimates. Begin/continue TAC and Management Board development of specific management recommendations.
R	"On Alert" Finalize development and implement appropriate management actions to get back on track.

2020 Decision Matrix Results

Water quality (chlorophyll-a and light penetration) remained supportive of seagrass in Hillsborough Bay (HB), Middle Tampa Bay (MTB), and Lower Tampa Bay (LTB) (Table 1, Figure 3). The nuisance algae, *Pyrodinium bahamense*, was again reported in Old Tampa Bay (OTB) during May - September 2019, contributing to a large magnitude chlorophyll-a exceedance that has persisted for a long duration (5yrs). However, it should be noted that effective light penetration was still observed to be supportive of seagrass in all bay segments, including OTB (Table 1).

Table 1: Water quality outcomes for 2020.

Segment	Chl-a (ug/L)		Light Penetration (m ⁻¹)	
	2020	target	2020	target
OTB	9.8	8.5	0.69	0.83
HB	9.8	13.2	0.95	1.58
MTB	5.9	7.4	0.52	0.83
LTB	3.6	4.6	0.57	0.63

— Annual Mean — Management Target - - +1 se (small exceedance) - - +2 se (large exceedance)
